All-Pairs Shortest Paths

Idea Floyd-Warshall algorithm

- **Check if there is a better path from one vertex to other through each vertex**

Floyd-Warshall algorithm

- we shall use a different dynamic-programming formulation to solve the all-pairs shortest-paths problem on a directed graph $G = (V, E)$
- runs in $\theta(V^3)$ time
- negative-weight edges may be present, but we assume that there are no negative-weight cycles

Floyd-Warshall algorithm

- considers the intermediate vertices of a shortest path, where an intermediate vertex of a simple path $p = \langle v_1, v_2, \ldots, v_l \rangle$ is any vertex of p other than v_1 or v_l, that is, any vertex in the set $\{v_2, v_3, \ldots, v_{l-1}\}$
- If k is not an intermediate vertex of path p, then all intermediate vertices of path p are in the set {1, 2,…, k-1}

Floyd-Warshall algorithm

- Thus, a shortest path from vertex i to vertex j with all intermediate vertices in the set {1, 2,...,k -1} is also a shortest path from i to j with all intermediate vertices in the set {1, 2,...,k}
- If k is an intermediate vertex of path p, then we decompose p into $i \rightarrow^{p1} k \rightarrow^{p2} j$, as Figure 25.3 illustrates.

Floyd-Warshall algorithm

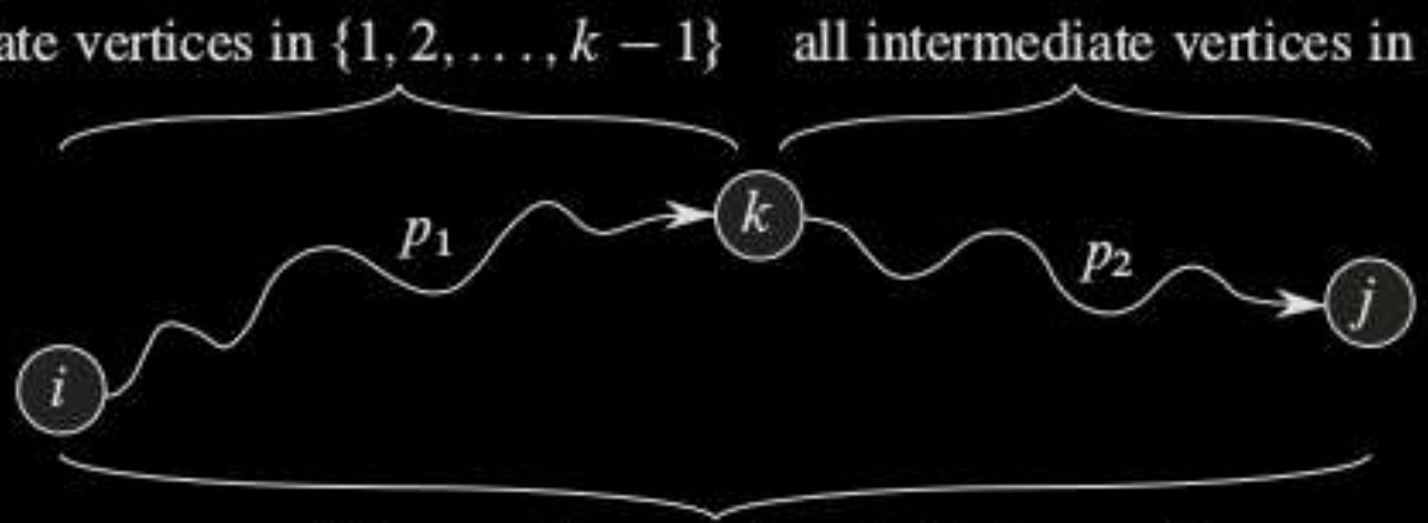

Figure 25.3 Path p is a shortest path from vertex i to vertex j, and k is the highest-numbered intermediate vertex of p. Path p_1, the portion of path p from vertex i to vertex k, has all intermediate vertices in the set $\{1, 2, \ldots, k-1\}$. The same holds for path p_2 from vertex k to vertex j.

A recursive solution to the all-pairs shortest-paths problem

- we define a recursive formulation of shortest-path estimates that differs from the one in Section 25.1.
- Let $d^{(k)}_{ij}$ be the weight of a shortest path from vertex i to vertex j for which all intermediate vertices are in the set {1, 2,...,k}
- When k = 0, a path from vertex i to vertex j with no intermediate vertex numbered higher than 0 has no intermediate vertices at all.

A recursive solution to the all-pairs shortest-paths problem

- Such a path has at most one edge, and hence $d^{(0)}_{ij} = w_{ij}$.
- Following the above discussion, we define $d^{(k)}_{ij}$ recursively by

$$d_{ij}^{(k)} = \begin{cases} w_{ij} & \text{if } k = 0 , \\ \min\left(d_{ij}^{(k-1)}, d_{ik}^{(k-1)} + d_{kj}^{(k-1)}\right) & \text{if } k \geq 1 . \end{cases} \qquad (25.5)$$

- We can give a recursive formulation of $\Pi^{(k)}_{ij}$. When k = 0, a shortest path from i to j has no intermediate vertices at all. Thus,

$$\pi_{ij}^{(0)} = \begin{cases} \text{NIL} & \text{if } i = j \text{ or } w_{ij} = \infty , \\ i & \text{if } i \neq j \text{ and } w_{ij} < \infty . \end{cases}$$

A recursive solution to the all-pairs shortest-paths problem

$$\pi_{ij}^{(k)} = \begin{cases} \pi_{ij}^{(k-1)} & \text{if } d_{ij}^{(k-1)} \le d_{ik}^{(k-1)} + d_{kj}^{(k-1)} \\ \pi_{kj}^{(k-1)} & \text{if } d_{ij}^{(k-1)} > d_{ik}^{(k-1)} + d_{kj}^{(k-1)} \end{cases}, \tag{25.7}$$

Floyd-Warshall algorithm

Floyd-Warshall algorithm

- Iteration 1 - Find path to all pair of vertices through vertex 1
- Fill cost of edges from 1 and into 1
